

## Effect on cotton genotypes (*Gossypium hirsutum* L. cv. Rowden, Auburn)

### 1. The net impact of individual and combined stress on plant growth

Crop: Cotton (*Gossypium hirsutum* L. cv. Rowden, Auburn 634+ more )  
 Stress 1: *Meloidogyne incognita*  
 Stress 2: *Fusarium oxysporum* f.sp. *Vasinfectedum*  
 Stage of plant: Plantlet

The table shows the impact of nematode and fungus in combination on plant mortality and vascular browning of cotton genotypes.

	Cultivars  Treatment ( <i>M.incognita</i> (10 eggs/500cm <sup>3</sup> soil)+ <i>F. oxysporum</i> )	Response to combined stress**		
		Type A parameters*		
		<i>F. oxysporum</i> (1800CFU/g soil)-1987	<i>F. oxysporum</i> (11900CFU/g soil)-1988	<i>F. oxysporum</i> (5900CFU/g soil)-1990
Mortality	<i>Auburn 634</i>	0.1	0.7	0.4

**Inference From the study:** Starr JL, Martyn RD (1991) studied the reaction of cotton cultivars to Fusarium wilt and root-knot nematodes. Simultaneous inoculation was done using different fungal inoculum levels in a different year. Cultivars were then analyzed for mortality, vascular browning, and nematode population. All Tex E2, DP SR383, PaymasterHS26, Rowden Dawson Co.81, Ranger BB53, Rilcot RK-7, GSA 71, Qaw Paw D cultivars showed more plant mortality and vascular browning, thus these are susceptible cotton cultivars. Nematode population was low at higher fungal inoculum in cultivar Rowden. Auburn 634, Tamcot SP21 showed lesser mortality rate and vascular browning, thus are tolerant cotton cultivars. **This pathogen combination works to cause severe disease complex in cotton cultivars All Tex E2, DP**
